

Quick-find [eager approach]

Data structure.

- Integer array `id[]` of length `N`.
- Interpretation: `p` and `q` are connected iff they have the same `id`.

if and only if
↙

	0	1	2	3	4	5	6	7	8	9
<code>id[]</code>	0	1	1	8	8	0	0	1	8	8

0, 5 and 6 are connected
1, 2, and 7 are connected
3, 4, 8, and 9 are connected

Quick-find [eager approach]

Data structure.

- Integer array `id[]` of length `N`.
- Interpretation: `p` and `q` are connected iff they have the same `id`.

	0	1	2	3	4	5	6	7	8	9
<code>id[]</code>	0	1	1	8	8	0	0	1	8	8

Find. Check if `p` and `q` have the same `id`.

`id[6] = 0; id[1] = 1`
6 and 1 are not connected

Union. To merge components containing `p` and `q`, change all entries whose `id` equals `id[p]` to `id[q]`.

	0	1	2	3	4	5	6	7	8	9
<code>id[]</code>	1	1	1	8	8	1	1	1	8	8

problem: many values can change

after union of 6 and 1

Quick-find demo

	0	1	2	3	4	5	6	7	8	9
id[]	1	1	1	8	8	1	1	1	8	8

Quick-find: Java implementation

```
public class QuickFindUF
{
```

```
    private int[] id;
```

```
    public QuickFindUF(int N)
    {
```

```
        id = new int[N];
        for (int i = 0; i < N; i++)
            id[i] = i;
```

← set id of each object to itself
(N array accesses)

```
    }
```

```
    public boolean connected(int p, int q)
    { return id[p] == id[q]; }
```

← check whether p and q
are in the same component
(2 array accesses)

```
    public void union(int p, int q)
    {
```

```
        int pid = id[p];
        int qid = id[q];
        for (int i = 0; i < id.length; i++)
            if (id[i] == pid) id[i] = qid;
```

← change all entries with id[p] to id[q]
(at most $2N + 2$ array accesses)

```
    }
```

```
}
```

Quick-find is too slow

Cost model. Number of array accesses (for read or write).

algorithm	initialize	union	find
quick-find	N	N	1

order of growth of number of array accesses

Union is too expensive. It takes N^2 array accesses to process a sequence of N union commands on N objects.

quadratic

Quadratic algorithms do not scale

Rough standard (for now).

- 10^9 operations per second.
- 10^9 words of main memory.
- Touch all words in approximately 1 second.

a truism (roughly)
since 1950!

Ex. Huge problem for quick-find.

- 10^9 union commands on 10^9 objects.
- Quick-find takes more than 10^{18} operations.
- 30+ years of computer time!

Quadratic algorithms don't scale with technology.

- New computer may be 10x as fast.
- But, has 10x as much memory \Rightarrow want to solve a problem that is 10x as big.
- With quadratic algorithm, takes 10x as long!
